

Why go electric

There are many benefits to using all electric appliances in your new home or when tackling that big renovation. Going all-electric will save you money, create a healthier home environment for you and your family and put you well on the path to sustainable living.

Benefits

More energy efficient.

Electric appliances, from heat pumps to induction stoves, are usually more energy-efficient than their fossil fuel counterparts. This can translate into lower utility bills and less energy waste. Additionally, electric systems are typically easier to integrate with smart home technologies, allowing for better energy management and increased convenience. Add an electric vehicle and avoid high fuel prices and tailpipe emissions.

Safer and healthier.

Electric systems eliminate the risk of gas leaks and reduce indoor air pollution (which can make asthma worse), creating a safer and healthier living environment.

Better for the planet.

With South Australia's grid charging towards being 100% renewable, when you switch on your electric appliance there is a fair chance it is being run from emissions free solar or wind power – how cool! Even better if you install solar panels.

Ask your sales consultant or builder

Do I have to connect to gas? Even though gas is a fossil fuel that will increase your carbon footprint and make global heating worse, some new developments say that gas connections are mandatory. Before signing your contract make sure you check what happens if you don't want gas and would prefer a cleaner, cheaper option.
